

Answer **four** questions. You are advised **not** to answer more than four questions: if you do, only your best four will be counted.

- 1 (i) (a) What does it mean to say that a topological space is *compact*?  
What does it mean to say that a topological space is *Hausdorff*?  
(4 marks)
- (b) Prove that any continuous bijection from a compact space to a Hausdorff space is a homeomorphism.  
(6 marks)
- (c) Show that the quotient space  $\overline{B}^2/S^1$  (the closed disc mod the boundary circle) is homeomorphic to  $S^2$ .  
(3 marks)
- (ii) (a) What is a path from  $a$  to  $b$  in a topological space  $X$ ? (2 marks)
- (b) Define the fundamental group  $\pi_1(X, x_0)$ . [You should define the underlying set and the group multiplication, and check the multiplication is well defined. You need not check the group axioms are satisfied.]  
(6 marks)
- (c) Show that for any two topological spaces  $X, Y$ , with basepoints  $x_0 \in X, y_0 \in Y$ , the fundamental group  $\pi_1(X \times Y; (x_0, y_0))$  is isomorphic to the product of  $\pi_1(X, x_0)$  and  $\pi_1(Y, y_0)$ .  
(4 marks)

- 2 (i) (a) What is a *covering map*? (4 marks)
- (b) State the Path Lifting Lemma for a covering map  $p : Y \rightarrow X$ , and explain how it can be used to define a function

$$\ell : \pi_1(X, x_0) \rightarrow p^{-1}(x_0),$$

where  $x_0 \in X$ . State conditions under which  $\ell$  is a bijection.

(8 marks)

- (ii) Let

$$SU(2) = \{A \in M_2(\mathbb{C}) \mid A\bar{A}^T = I, \det(A) = 1\}$$

be the  $2 \times 2$  special unitary group.

- (a) Show that

$$SU(2) = \left\{ \begin{pmatrix} \alpha & \beta \\ -\bar{\beta} & \bar{\alpha} \end{pmatrix} \mid |\alpha|^2 + |\beta|^2 = 1 \right\}.$$

Use this to show that  $\pi_1(SU(2), I)$  is the trivial group, where  $I$  is the identity matrix. (8 marks)

- (b) Consider the subgroup  $Z = \{I, -I\}$  of  $SU(2)$  and let  $PSU(2) = SU(2)/Z$ . Determine the fundamental group of  $PSU(2)$  using the image of  $I$  as basepoint. (5 marks)

- 3 (i) (a) What is a *chain complex* of abelian groups? What does it mean to say that two chain maps  $\theta, \phi : C_\bullet \rightarrow D_\bullet$  are *chain homotopic*. (5 marks)

- (b) Show that if  $\theta$  and  $\phi$  are chain homotopic, they induce the same map in homology. (4 marks)

- (ii) (a) Show that if  $K$  is a simplicial complex,  $P$  is a new vertex and  $c_P K$  is the  $P$ -cone on  $K$  then  $H_i(c_P K) = 0$  for  $i > 0$ . Explain the relevance of this to the homology of the standard abstract simplex  $\Delta^n$ . (8 marks)

- (b) If  $K$  consists of all subsets of  $\{0, 1, 2, 3, 4\}$  with  $\leq 3$  elements (i.e., the 2-skeleton of  $\Delta^4$ ), calculate  $H_*(K)$ . (8 marks)

- 4 (i) (a) Suppose that  $C_\bullet$  is a chain complex with only finitely many terms non-zero and all terms finite dimensional vector spaces. What is the Lefschetz number  $\Lambda(\theta)$  of a chain map  $\theta : C_\bullet \rightarrow C_\bullet$ ? (2 marks)
- (b) Show that  $\Lambda(\theta) = \Lambda(\theta_*)$  where  $\theta_* : H_*(C_\bullet) \rightarrow H_*(C_\bullet)$  is the induced map in homology. (6 marks)
- (c) State the Lefschetz Fixed Point Theorem. (2 marks)
- (ii) Consider maps  $f : T \rightarrow T$ , where  $T$  denotes the 2-torus.
- (a) Calculate the homology of  $T$ . (6 marks)
- (b) Is there a map  $f : T \rightarrow T$  homotopic to the identity which has no fixed points? Justify your answer. (2 marks)
- (c) Suppose that  $f$  induces the identity map on  $H_0(T)$  and  $H_2(T)$  and that  $f_*(x) = -x$  for  $x \in H_1(T)$ . Calculate the Lefschetz number of  $f$  and deduce that  $f$  must have a fixed point. Describe such a map  $f$  which has exactly 4 fixed points. (3 marks)
- (d) Suppose that a group  $G$  of order 2 acts on  $T$  with 4 fixed points, and that  $T/G$  is an orientable surface. Find the genus of  $T/G$ . (4 marks)
- 5 Are the following true or false. Justify your answers.
- (i) Any self-map of a contractible space has a fixed point. (5 marks)
- (ii)  $\mathbb{R}^2$  is homeomorphic to  $\mathbb{R}^3$ . (5 marks)
- (iii) The Klein bottle admits the structure of a topological group. (5 marks)
- (iv) The Euler characteristic distinguishes the homotopy types of connected one dimensional simplicial complexes. (5 marks)
- (v) If  $K$  and  $L$  are simplicial complexes, any continuous function  $f : |K| \rightarrow |L|$  is homotopic to a map  $|s|$  for a simplicial map  $s : K \rightarrow L$ . (5 marks)
